Candler, NC 28715

CONGRATULATIONS!

Your new trailer comes equipped with Kenda tires featuring wheels and tires balanced with Counteract Balancing Beads. Balancing beads are an internal balancing product that will fulfill all your balancing needs, because they balance more than just the tire. This patented technology efficiently and effectively addresses more problems simultaneously, which exceeds the performance offered by any other balancing system. Balancing the entire wheel assembly attacks the vibration forces that can be caused by an out-of-balance assembly. Reduced vibration, extended tire life, and no more hammer-on weights are major benefits of the system. More importantly, your tires and wheels are constantly being rebalanced, adjusting to the changing conditions of the total tire and wheel assembly. Unlike wheel weights, Counteract Balancing Beads are free to constantly adjust the balancing needs of the wheel; they last the complete life of the tires and can even be reused with your next set of tires.

How They Work

When Counteract Balancing Beads (recycled tempered glass) are installed inside the tire the specially coated microspheres are distributed throughout the tire through centrifugal force as the wheel rotates. As the force of the out-of-balance area increases and impacts the assembly performance the inertia causes the beads to move in the opposite direction and rapidly shift until the complete wheel assembly is balanced. Your assemblies are constantly being rebalanced to adjust to the conditions you face every day. The tempered glass beads will not react to any metal or other materials and do not break down when used in tires. If you would like additional information please visit the following websites:
